

Annual Drinking Water Quality Report

Bold Camp / Mill Creek - PWSID NO. 1195640

INTRODUCTION

This Annual Drinking Water Quality Report for calendar year 2025 is designed to inform you about your drinking water quality. Our goal is to provide you with a safe and dependable supply of drinking water, and we want you to understand the efforts we make to protect your water supply. The quality of your drinking water must meet state and federal requirements administered by the Virginia Department of Health (VDH).

If you have questions about this report or want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect the quality of your drinking water, please contact: Bobby Reynolds at 276-762-0159.

The times and location of regularly scheduled board meetings are as follows:

Location: Wise County PSA Office 5622 Industrial Park Rd, Wise, VA 24293

Date: 2nd Tuesday of each month Time: 6:00 PM

For additional information, call (276) 679 -1520.

GENERAL INFORMATION

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Contaminants that may be present in source water include: (i) microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (ii) inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; (iii) pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; (iv) organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems; (v) radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer who are undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

SOURCE(S) and TREATMENT OF YOUR DRINKING WATER

The source(s) of your drinking water is surface water from The John Flannagan Water Authority via the Town of Clintwood.

Is there any treatment of your drinking water supply? (X) Yes () No

Treatment of the raw water from John Flannagan Reservoir consists of chemical addition, coagulation, flocculation, settling, filtration, fluoridation, and chlorination. All these processes work together to remove the physical, chemical, and biological contaminants to make the water safe for drinking.

The Virginia Department of Health conducted a source water assessment of our system during 2020. The John Flannagan Water Authority source water was determined to be of high susceptibility to contamination using the criteria developed by the state in its approved Source Water Assessment Program. The assessment report consists of maps showing the source water assessment area, an inventory of known land use activities of concern, and documentation of any known contamination. The report is available by contacting Dennis Baker at the phone number or address given elsewhere in this drinking water quality report.

DEFINITIONS

Contaminants in your drinking water are routinely monitored according to Federal and State regulations. The table on the next page shows the results of our monitoring for the period of January 1st to December 31st, 2025. In the table and elsewhere in this report you will find many terms and abbreviations you might not be familiar with. The following definitions are provided to help you better understand these terms:

Maximum Contaminant Level, or MCL - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal, or MCLG - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level Goal or MRDLG: the level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level or MRDL: the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Non-detects (ND) - lab analysis indicates that the contaminant is not present

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Treatment Technique (TT) - a required process intended to reduce the level of a contaminant in drinking water.

Level 1 Assessment - a study of the water system to identify potential problems and determine (if possible) why total coliform bacteria have been found in our water system.

Level 2 Assessment - a very detailed study of the waterworks to identify potential problems and determine (if possible) why an *E. coli* PMCL violation has occurred and/or why total coliform bacteria have been found in our water system on multiple occasions.

Nephelometric Turbidity Unit (NTU) - nephelometric turbidity unit is a measure of the clarity, or cloudiness, of water. Turbidity in excess of 5 NTU is just noticeable to the average person. Turbidity is monitored because it is a good indicator of the effectiveness of our filtration system.

WATER QUALITY RESULTS

Regulated Contaminants- Bold Camp

Contaminant (units)	MCLG	MCL	Level Detected	Violation (Y/N)	Range	Date of Sample	Typical Source of Contamination
Chlorine (ppm)	MRDLG = 4	MRDL = 4	0.62	N	0.20-1.20	2025	Water additive used to control microbes
Haloacetic Acids (ppb)	NA	60	31	N	12-47	2025	By-product of drinking water disinfection
Total Trihalomethanes (ppb)	NA	80	57	N	45-66	2025	By-product of drinking water disinfection

Regulated Contaminants- John Flannagan Water Authority

Contaminant (units)	MCLG	MCL	Level Detected	Violation (Y/N)	Range	Date of Sample	Typical Source of Contamination
Nitrate (ppm)	10	10	0.1	N	NA	2025	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits
Fluoride (ppm)	4	4	0.54	N	0.356-0.54	2025	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Barium (ppm)	2	2	0.022	N	NA	2025	Discharge of drilling waste; Discharge from metal refineries; Erosion of natural deposits
Alpha Emitters (pCi/l)	0	15	0.4	N	NA	2020	Erosion of Natural Deposits
Combined Radium (pCi/l)	0	5	0.4	N	NA	2020	Erosion of Natural Deposits
Beta/photon emitters (pCi/l)	0	50	0.6	N	NA	2020	Decay of natural and man-made deposits.
Chlorine (ppm)	MRDLG = 4	MRDL = 4	1.74	N	1.44-2.1	2025	Water additive used to control microbes
Total Organic Carbon	NA	TT, met when ≥ 1	1.56	N	1.4-1.79	2025	Naturally present in the environment
Turbidity	NA	TT, 1 NTU Max	0.07	N	0.05-0.09		Soil runoff
		TT, ≤ 0.3 NTU 95% of the time	100%	N			

Lead and Copper Contaminants- Bold Camp

Contaminant (units)	MCLG	Action Level	90 th Percentile	Date of Sampling	# of Sampling Sites Exceeding Action Level	Typical Source of Contamination
Lead (ppb)	0	AL = 15	0	2025	0	Corrosion of household plumbing systems; Erosion of natural deposits
Copper (ppm)	1.3	AL = 1.3	0.069	2025	0	Corrosion of household plumbing systems; Erosion of natural deposits

John Flannagan Water Authority

Monitoring Results for Sodium (Unregulated - No Limits Designated)			
Level Detected (unit)	Sample Date	Typical Source	Guidance
12.7 (mg/L)	03/19/2025	Naturally Occuring; Addition of treatment chemicals/processes	For individuals on a <u>very</u> low sodium diet (500 mg/day), EPA recommends that drinking-water sodium not exceed 20 mg/L. Should you have a health concern, contact your health care provider.

The state allows us to monitor for some contaminants less than once per year because the concentrations of these contaminants do not change frequently. Some of our data presented in the above tables, though accurate, is more than one year old.

MCL's are set at very stringent levels by the U.S. Environmental Protection Agency. In developing the standards EPA assumes that the average adult drinks 2 liters of water each day throughout a 70-year life span. EPA generally sets MCLs at levels that will result in no adverse health effects for some contaminants or a one-in-ten-thousand to one-in-a-million chance of having the described health effect for other contaminants.

VIOLATION INFORMATION – Did any PMCL or TT violation occur during the year? () Yes (X) No

VIOLATION INFORMATION – Did any monitoring, reporting, or other violations occur during the year? () Yes (X) No

Other Information

Sodium

There is presently no established standard for sodium in drinking water. Water containing more than 270 ppm of sodium should not be used as drinking water by those persons whose physician has placed them on a moderately restricted sodium diet. Water containing more than 20 ppm should not be used as drinking water by those persons whose physician has placed them on a severely restricted sodium diet. For informational purposes, we wish to point out that our most recent sampling (2025) results indicate that your water has a sodium content of 12.7 ppm.

Lead Service Line Inventory (LSLI)

The Wise County PSA has completed the initial requirement of the Lead Service Line Inventory (LSLI) and submitted a copy of the LSLI to the Virginia Department of Health (VDH), Office of Drinking Water. The current inventory results are accessible online by visiting the following website at <https://arcg.is/19fi4WO>. Paper versions of the Customer LSLI Survey Forms are still available for completion in the office.

ADDITIONAL HEALTH INFORMATION

Lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Wise County Public Service Authority is responsible for providing high quality drinking water and removing lead pipes, but cannot control the variety of materials used in plumbing components in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family's risk. Before drinking tap water, flush your pipes for several minutes by running your tap, taking a shower, doing laundry or a load of dishes. You can also use a filter certified by an American National Standards Institute accredited certifier to reduce lead in drinking water. If you are concerned about lead in your water and wish to have your water tested, contact Bobby Reynolds at 276-762-0159. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <http://www.epa.gov/safewater/lead>

This report shows that your drinking water exceeds all State and Federal requirements We will readily accept any comments or questions concerning this report. To view a digital copy of this report, please visit the Wise County PSA website at <https://wisecountypsa.org/water-quality-report>. A paper copy of this CCR can also be obtained at the Wise County PSA Office.

For more information, please contact:

For questions, comments, or concerns about any of the information in this report or the public water system, please contact the following person.
